

## **In The Beginning - Birth**

*by Dennis Lange*

As a baby grows within its mother's womb, the lungs are one of the last things to develop. It isn't the lungs of the baby that provide the oxygen for the baby, but blood from the mother. Blood isn't even routed through the still-developing lungs of the fetus. At birth, the shunt that allows blood to bypass a fetus's lungs is closed by a muscle that works its magic once and only once. Then, blood flows through the baby's lungs for the first time for the oxygen-carbon dioxide exchange.

Evolution has no answer for how such a necessary system could develop by chance. God created in a marvelous way.

*Ps.22:9 You are He who brought me forth from the womb.*
