Marsupial Frogs

by Dennis Lange

The female marsupial frog lays eggs. The male scoops them up and spreads them across his back. The sticky eggs remain there, and the skin on the male's back softens. The eggs are pulled into tiny pools that form. Then, a sheet of skin grows over the pools on the back of the male frog and the development of the tadpoles continues under the special flap. Notice all the elements that must work together for the species to survive:

- male;
- female;
- eggs;
- the male's response;
- the stickiness;
- the softening;
- the sheet of skin that begins to grow and cover the eggs so they can develop.

The marsupial frog isn't the product of evolutionary chance, but was created by the awesome God of the Bible.

Ps.32:8,9 fear the Lord...for He spoke, and it came to be.
